

Rainwater Rewards Program Design Checklist

The checklist below provides additional information for stormwater management projects that require structural designs, including bio-infiltration or bio-filtration basins, pervious pavement, green roofs or other projects that would require some level of design.

Review the requirements for stormwater management projects below and complete the checklist to ensure the application and plan are complete.

- Plan drawn to scale that shows the following:
 - Property location in relation to property lines, buildings, driveway, roads, utilities, easements or other amenities
 - Location and size of proposed project
 - Drainage area and impervious surface percentage draining to project
 - Existing and proposed elevations
 - Planting plan
 - Erosion and sediment control measures
 - Cross section for the proposed project
- Description and photos of site investigation
- Project permit requirements, if applicable
- Itemized cost estimate for the project

Depending on site conditions and project details, staff may request more information than is listed above. The more detailed the plan and cost estimate provided, the better prepared city staff can review and approve the project.
