2018 Drinking Water Report

Translational for this report

This report contains important information about your drinking water. Have someone translate it for you, or speak with someone who understands it.

Información importante. Si no la entiende, haga que alguien se la traduzca ahora.

Additional monitoring may have been done for contaminants that are not included in the Safe Drinking Water Act. To request a copy of these results, call the Minnesota Department of Health at 651.201.4700 or 1.800.818.9318 between 8 a.m. and 4:30 p.m., Monday through Friday.

Did you know?

Most Minnesotans, whether they drink from a public water supply or a private well, have drinking water that doesn’t need treatment for health protection. Water treatment units are best for improving the physical qualities of water, such as taste, color or odor. Visit http://bit.ly/2UEreRR to learn more about home water treatment.

Reading the water quality data tables

The tables on the following pages show the contaminants found last year or the most recent time water was sampled for that contaminant. They also show the levels of those contaminants and the EPA’s limits.

Substances that were tested for and were not found are not included in the tables. Some contaminants are sampled for less than once a year because their levels in water are not expected to change from year to year. Any contaminants found the last time they were sampled for are included in the tables below with the detection date.

St. Louis Park monitoring results

This report contains the City of St. Louis Park monitoring results from January 1 to December 31, 2018. The purpose of this report is to advance understanding of drinking water and heighten awareness of the need to protect precious water resources.

The city works with the Minnesota Department of Health to test drinking water for more than 100 contaminants. It is not unusual to detect contaminants in small amounts. No water supply is ever completely free of contaminants. Drinking water standards protect Minnesotans from substances that may be harmful to their health.

Making safe drinking water

Your drinking water comes from a groundwater source: nine wells, ranging from 485 to 1095 feet deep, that draw water from the Prairie Du Chien-Jordan, Mt. Simon, Jordan and Jordan-St. Lawrence aquifers.

St. Louis Park works hard to provide safe and reliable drinking water that meets federal and state water quality requirements. The purpose of this report is to provide information on drinking water and tips on how to protect precious water resources.

Contact Jay Hall, utilities superintendent, at 952.924.2557 or jhall@stlouispark.org if you have questions about St. Louis Park’s drinking water. You can also ask for information about how you can take part in decisions that may affect water quality.

The EPA sets safe drinking water standards. These standards limit the amounts of specific contaminants allowed in drinking water and ensure tap water is safe to drink for most people. The U.S. Food and Drug Administration regulates the amount of certain contaminants in bottled water. Bottled water must provide the same public health protection as public tap water.

Drinking water, including bottled water, may reasonably be expected to contain small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. For more information about contaminants and potential health effects call the EPA’s Safe Drinking Water Hotline at 1.800.426.4791.

Some people are more vulnerable to contaminants in drinking water

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. The developing fetus and therefore pregnant women may also be more vulnerable to contaminants in drinking water. These people or their caregivers should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 1.800.426.4791.
INORGANIC & ORGANIC CONTAMINANTS — Tested in drinking water.

<table>
<thead>
<tr>
<th>Contaminant (Date, if sampled in previous year)</th>
<th>EPA’s limit (MCL)</th>

<td>5.4 pCi/l</td>
<td>3.2 - 5.4 pCi/l</td>
<td>NO</td>
<td>Erosion of natural deposits.</td>
</tr>
</tbody>
</table>

**The upper range of detected test results is higher than the highest average or highest single test results because the results for each category reflect different time frames in which samples were taken.

Potential health effects and corrective action (if applicable)
**Combined radium:** During the year St. Louis Park’s system had a combined radium result(s) that was equal to the MCL at Water Treatment Plant #6. By the end of the year, only one quarterly sample had been analyzed. Since there is variability in sampling results, and this is not an acute contaminant, four quarterly sample results are used to determine compliance. Quarterly monitoring for combined radium is being conducted on Water Treatment Plant #6.

OTHER SUBSTANCES — Tested in drinking water.

<table>
<thead>
<tr>
<th>Substance (Date, if sampled in previous year)</th>

<tbody>
<tr>
<td>Fluoride</td>
<td>4.0 ppm</td>
<td>4.0 ppm</td>
<td>0.67 ppm</td>
<td>0.66 - 0.69 ** ppm</td>
<td>NO</td>
<td>Erosion of natural deposits; Water additive to promote strong teeth.</td>
</tr>
</tbody>
</table>

**The upper range of detected test results is higher than the highest average or highest single test results because the results for each category reflect different time frames in which samples were taken.

Fluoride: Fluoride is nature’s cavity fighter, with small amounts present naturally in many drinking water sources. An overwhelming weight of credible, peer-reviewed, scientific evidence shows that fluoridation reduces tooth decay and cavities in children and adults, even when there is availability of fluoride from other sources, such as fluoride toothpaste and mouth rinses. Since studies show that optimal fluoride levels in drinking water benefit public health, municipal community water systems adjust the level of fluoride in the water to a concentration between 0.5 to 1.5 parts per million (ppm), with an optimal fluoridation goal between 0.7 and 1.2 ppm to protect teeth. Fluoride levels below 2.0 ppm are not expected to increase the risk of a cosmetic condition known as enamel fluorosis.
In addition to testing drinking water for contaminants regulated under the Safe Drinking Water Act, monitoring for contaminants that are not regulated sometimes take place. Unregulated contaminants do not have legal limits for drinking water.

Detection alone of a regulated or unregulated contaminant should not cause concern. The meaning of a detection should be determined considering current health effects information. Information about health effects can change over time.

The table to the right shows the unregulated contaminants detected last year, as well as human-health based guidance values for comparison where available. The comparison values are based only on potential health impacts and do not consider the ability to measure contaminants at very low concentrations or the cost and technology of prevention and/or treatment. They may be set at levels that are costly, challenging or impossible for water systems to meet (for example, large-scale treatment technology may not exist for a given contaminant).

A person drinking water with a contaminant at or below the comparison value would be at little or no risk for harmful health effects. If the level of a contaminant is above the comparison value, people of a certain age or with special health conditions - like a fetus, infants, children, elderly, and people with impaired immunity – may need to take extra precautions. Because these contaminants are unregulated, EPA and MDH require no particular action based on detection of an unregulated contaminant. As a public education opportunity, you are being notified of the unregulated contaminants detected.

More information from MDH:

Lead in drinking water

You may be in contact with lead through paint, water, dust, soil, food, hobbies or your job. Coming in contact with lead can cause serious health problems for everyone. There is no safe level of lead. Babies, children under the age of six and pregnant women are at the highest risk.

Lead is rarely in a drinking water source, but it can get in your drinking water as it passes through lead service lines and your household plumbing system. St. Louis Park provides high-quality drinking water, but it can’t control the plumbing materials used in private buildings.

Read below to learn how you can protect yourself from lead in drinking water.

1. **Let the water run** for 30-60 seconds before using it for drinking or cooking if the water has not been turned on in more than six hours. If you have a lead service line, you may need to let the water run longer. A service line is the underground pipe that brings water from the main water pipe under the street to your home.
   - You can find out if you have a lead service to your home by contacting your public water system, or visit http://bit.ly/2UHmefw and follow the steps to check.
   - The only way to know if lead has been reduced by letting it run is to check with a test. If letting the water run doesn’t reduce lead, consider other options to reduce your exposure.
2. **Use cold water** for drinking, making food and making baby formula. Hot water releases more lead from pipes than cold water.
3. **Test your water.** In most cases, letting the water run and using cold water for drinking and cooking should keep lead levels low in your drinking water. If you are still concerned about lead, arrange with a laboratory to test your tap water. Testing your water is important if young children or pregnant women drink your tap water. Contact an MDH-accredited laboratory for a sample container and instructions on how to submit a sample. Visit http://bit.ly/2IB0HxU for the Environmental Laboratory Accreditation Program. MDH can help you understand your test results.
4. **Treat your water** if a test shows your water has high levels of lead after you let the water run. Visit http://bit.ly/2VNdOPY to learn about water treatment units.

Learn more

- Visit http://bit.ly/2XgEhFU to learn about lead in drinking water.
- Visit www.epa.gov/safewater/lead for basic information about lead in drinking water.

- Visit Lead Poisoning Prevention: Common Sources at http://bit.ly/2Uj1LbJ to learn about how to reduce your contact with lead.
Learn more about your drinking water

**Drinking water sources:** Minnesota’s primary drinking water sources are groundwater and surface water. Groundwater is the water found in aquifers beneath the surface of the land. Groundwater supplies 75 percent of Minnesota’s drinking water. Surface water is the water in lakes, rivers and streams above the surface of the land and supplies 25 percent of Minnesota’s drinking water.

Contaminants can make their way into drinking water sources from the natural environment and from people’s daily activities. Five main types of contaminants are in drinking water sources.

- **Microbial contaminants**, such as viruses, bacteria and parasites. Sources include sewage treatment plants, septic systems, agricultural livestock operations, pets and wildlife.
- **Inorganic contaminants** include salts and metals from natural sources (e.g. rock and soil), oil and gas production, mining and farming operations, urban stormwater runoff and wastewater discharges.
- **Pesticides and herbicides** are chemicals used to reduce or kill unwanted plants and pests. Sources include agriculture, urban stormwater runoff, and commercial and residential properties.
- **Organic chemical contaminants** include synthetic and volatile organic compounds. Sources include industrial processes and petroleum production, gas stations, urban stormwater runoff and septic systems.
- **Radioactive contaminants** such as radium, thorium and uranium isotopes come from natural sources (e.g. radon gas from soils and rock), mining operations, and oil and gas production.

The Minnesota Department of Health provides information about your drinking water source(s) in a source water assessment, including:

- How St. Louis Park is protecting your drinking water source(s)
- Nearby threats to your drinking water sources
- How easily water and pollution can move from the surface of the land into drinking water sources, based on natural geology and the way wells are constructed.

Find your source water assessment at [http://bit.ly/2XhWbZb](http://bit.ly/2XhWbZb) or call 651.201.4700 or 1.800.818.9318 between 8 a.m. and 4:30 p.m., Monday through Friday.

**Conserve water**

**Sprinkling ordinance**
To conserve water, St. Louis Park prohibits lawn sprinkling between noon and 6 p.m. In addition, all households and businesses must follow an odd/even schedule when sprinkling lawns. Properties that end with an odd number sprinkle on the odd-numbered days on the calendar; properties that end with an even number sprinkle on even-numbered days.

Additional conservation measures may be required during critical water shortages. These can include limiting watering to once every five days or banning all outdoor sprinkling. Should this situation arise, a public notice will be given.

**Exceptions**
New sod or seed, and newly planted shrubs, trees and landscaping are exempt from the odd/even schedule. Flower gardens are also exempt. Even in these circumstances, sprinkling must be done before noon or after 6 p.m.

**Questions? Contact:**
Jay Hall, utilities superintendent
St. Louis Park Municipal Service Center, 7305 Oxford St.
