The City of St. Louis Park is issuing the results of monitoring done on its drinking water for the period from January 1 to December 31, 2014. The purpose of this report is to advance consumers’ understanding of drinking water and to heighten awareness of the need to protect precious water resources.

Source of Water

The City of St. Louis Park provides drinking water to its residents from a groundwater source: 13 wells ranging from 446 to 1095 feet deep, that draw water from the Prairie Du Chien-Jordan, Mt. Simon and Jordan-St. Lawrence aquifers.

The Minnesota Department of Health has made a determination as to how vulnerable our systems’ source(s) of water may be to future contamination incidents. If you wish to obtain the entire source water assessment regarding your drinking water, please call (651) 201-4700 or 1-800-818-9318 (and press 5) during normal business hours. Also, you can view it online at www.health.state.mn.us/divs/eh/water/swp/swa.

Call (952) 924-2562 if you have questions about the City of St. Louis Park drinking water or would like information about opportunities for public participation in decisions that may affect the quality of the water.
Results of Monitoring

No contaminants were detected at levels that violated federal drinking water standards. However, some contaminants were detected in trace amounts that were below legal limits. The table that follows shows the contaminants that were detected in trace amounts last year. Some contaminants are sampled less frequently than once a year; as a result, not all contaminants were sampled for in 2014. If any of these contaminants were detected the last time they were sampled for, they are included in the table along with the date that the detection occurred.

****Highest and Lowest Monthly Average
*****Highest Quarterly Average
If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of St. Louis Park is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

Monitoring may have been done for additional contaminants that do not have MCLs established for them and are not required to be monitored under the Safe Drinking Water Act. Results may be available by calling (651) 201-4700 or 1-800-818-9318 during normal business hours.

Monitoring for unregulated contaminants as required by U.S. Environmental Protection Agency rules (40 CFR 141.40) was conducted in 2014. Results of the unregulated contaminant monitoring are available upon request from Cindy Swanson, Minnesota Department of Health, at (651) 201-4656.

### Compliance with National Primary Drinking Water Regulations

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- **Radioactive contaminants**, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U. S. Environmental Protection Agency (EPA) prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.
Conserve Water

2014 St. Louis Park Water Facts

- 2,093,151,000 gallons of water pumped from the ground in 2014.
- The highest daily amount of water pumped was 10,026,000 on August 7, 2014.

Use Water Wisely

- When brushing your teeth, always turn the water off.
- Fix leaky faucets and toilets; these fixtures can waste hundreds of gallons of water per year.
- Keep drinking water in the refrigerator instead of letting the faucet run until the water is cool.

Sprinkling Ordinance

To conserve water, St. Louis Park prohibits lawn sprinkling between noon and 6 p.m. In addition, all households and businesses must follow an odd/even schedule when sprinkling lawns. (Properties that end with an odd number sprinkle on the odd-numbered days on the calendar; properties that end with an even number sprinkle on even-numbered days.)

Additional conservation measures may be required during critical water shortages. These can include limiting watering to once every five days or banning all outdoor sprinkling. Should this situation arise, a public notice will be given.

Exceptions

New sod or seed, and newly planted shrubs, trees and landscaping are exempt from the odd/even schedule. Flower gardens are also exempt. Even in these circumstances, sprinkling must be done before noon or after 6 p.m.

Career Opportunity

Water Environment Technology

St. Cloud Technical and Community College’s Water Environment Technologies (WETT) program provides you with the skills you need to land a great job in this rapidly growing industry.

There are many benefits to this program:

- Hands-on learning
- 12-month program
- Metro and St. Cloud location
- 95 percent placement rates

Call St. Cloud Technical and Community College at (320) 308-5952 for more information on this program or email Instructor Bill Spain at bspain@sctcc.edu.
